

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) An information management apparatus, comprising:
a communication section ~~for transmitting/receiving~~ configured to transmit/receive
data through a wireless or wired transmission path;
a data processing section ~~for processing~~ configured to process the data
transmitted/received by the communication section;
a memory space in which a file processed by the data processing section is arranged;
and
archive-file creating means for creating an archive file for at least one file to be
backed up, wherein identification information of a destination terminal at which the archive
file is to be decompressed is attached to the archive file so that the archive file can be
decompressed only at the destination terminal specified by the identification information.
2. (Previously Presented) The information management apparatus according to claim
1, further comprising:
access management means for managing access to the at least one file whose archive
file was created.
3. (Previously Presented) The information management apparatus according to claim
2, further comprising:
file-link designating means for designating a link of files to be simultaneously
opened,

wherein the file associating designating means designates a link between the at least one file whose archive file was created and an access management information file in which access management information for the at least one file is described, and

when the at least one file whose archive file was created is accessed, the access management means simultaneously opens the access management file, performs access management in accordance with the access management information, and updates content of the access management information.

4. (Previously Presented) The information management apparatus according to claim 3, wherein the access management information file includes a counter value, as the access management information, for the at least one file whose archive file was created; and

the access management means decrements the counter value every time the access management information file is opened.

5. (Currently Amended) The information management apparatus according to claim 1, wherein the memory space employs a directory structure, and

the archive-file creating means creates an archive file for a directory to be backed up, wherein identification information of a destination terminal at which the archive file for the directory is to be decompressed is attached to the archive file.

6. (Currently Amended) An information management method, comprising:

a communication step of transmitting/receiving data through a wireless or wired transmission path;

a data-processing step of processing the data transmitted/received in the communication step;

a step of arranging a file, processed in the data processing step, in the memory space;
and

an archive-file creating step of creating an archive file for at least one file to be backed up, identification information of a destination terminal at which the archive file is to be decompressed being attached to the archive file so that the archive file can be decompressed only at the destination terminal specified by the identification information.

7. (Previously Presented) The information management method according to claim 6, further comprising:

an access management step of managing access to the at least one file whose archive file was created.

8. (Previously Presented) The information management method according to claim 7, further comprising:

a file-link designating step of designating a link of files to be simultaneously opened, wherein, in the file-link designating step, a link between the at least one file whose archive file was created and an access management information file in which access management information for the at least one file is described is designated, and

in the access management step, when the at least one file whose archive file was created is accessed, the access management file is simultaneously opened, access management is performed in accordance with the access management information, and a content of the access management information is updated.

9. (Previously Presented) The information management method according to claim 8, wherein the access management information file includes a counter value, as the access management information, for the at least one file whose archive file was created; and
the counter value is decremented every time the access management information file is opened in the access management step.

10. (Currently Amended) The information management method according to claim 6, wherein the memory space employs a directory structure, and
in the archive-file creating step, an archive file for a directory to be backed up is created, identification information of a destination terminal at which the archive file for the directory is to be decompressed being attached to the archive file.
